Is my water safe?

We are pleased to present this year's Annual Water Quality Report (Consumer Confidence Report) as required by the Safe Drinking Water Act (SDWA). This report is designed to provide details about where your water comes from, what it contains, and how it compares to standards set by regulatory agencies. This report is a snapshot of last year's water quality. We are committed to providing you with information because informed customers are our best allies.

Where does my water come from?

The City of Ammon has nine deep water wells throughout the city, with the addition of a new well that came online in 2022. Four of these wells run only during high demand times.

Why are there contaminants in my drinking water?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's (EPA) Safe Drinking Water Hotline (800-426-4791).

Unit Descriptions								
Term	Definition							
ug/L	ug/L : Number of micrograms of substance in one liter of water							
ppm	ppm: parts per million, or milligrams per liter (mg/L)							
ppb	ppb: parts per billion, or micrograms per liter (mg/L)							
pCi/L	pCi/L: picocuries per liter (a measure of radioactivity)							
NA	NA: not applicable							
ND	ND: Not detected							
NR	NR: Monitoring not required, but recommended.							

Important Drinking Water Definitions								
Term	Definition							
MCLG	MCLG: Maximum Contaminant Level Goal: The level of a contaminant in drinking water below							
	which there is no known or expected risk to health. MCLGs allow for a margin of safety.							
MCL	ICL MCL: Maximum Contaminant Level: The highest level of a contaminant that is allowed in dr							
	water. MCLs are set as close to the MCLGs as feasible using the best available treatment							
	technology.							
AL	AL: Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or							
	other requirements which a water system must follow.							
MRDL	MRDLG: Maximum residual disinfection level goal. The level of a drinking water disinfectant							
G	below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of							
	the use of disinfectants to control microbial contaminants.							
MRDL	MRDL: Maximum residual disinfectant level. The highest level of a disinfectant allowed in drinking							
	water. There is convincing evidence that addition of a disinfectant is necessary for control of							
	microbial contaminants.							
MNR	MNR: Monitored Not Regulated							
MPL	MPL: State Assigned Maximum Permissible Level							

ANNUAL WATER QUALITY REPORT

Water Testing Performed In 2024

Population Served 17,933

Water Quality Data Table

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of contaminants in water provided by public water systems. The table below lists all of the drinking water contaminants that we detected during the calendar year of this report. Although many more contaminants were tested, only those substances listed below were found in your water. All sources of drinking water contain some naturally occurring contaminants. At low levels, these substances are generally not harmful in our drinking water. Removing all contaminants would be extremely expensive, and in most cases, would not provide increased protection of public health. A few naturally occurring minerals may actually improve the taste of drinking water and have nutritional value at low levels. Unless otherwise noted, the data presented in this table is from testing done in the calendar year of the report. The EPA or the State requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not vary significantly from year to year, or the system is not considered vulnerable to this type of contamination. As such, some of our data, though representative, may be more than one year old. In this table you will find terms and abbreviations that might not be familiar to you. To help you better understand these terms, we have provided the definitions below the table.

	MCLG	MCL,	Detect In	Ra	nge							
	or	TT, or	Your			Sample						
Contaminants	MRDLG	MRDL	Water	Low	High	Date	Violation	Typical Source				
Inorganic Contaminants												
Arsenic (ppb)	0	10	2	1	2	2023	No	Erosion of natural deposits; Runoff from orchards; Runoff from glass and electronics production wastes				
Barium (ppm)	2	2	.147	.098	.147	2023	No	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits				
Chromium (ppb)	100	100	4	3	4	2023	No	Discharge from steel and pulp mills; Erosion of natural deposits				
Fluoride (ppm)	4	4	.2	NA	.2	2023	No	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories				
Nitrate (ppm)	10	10	2.72	1.50	2.72	2023-24	YES**	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits				
Radioactive Contaminants												
Radium (226/228) (pCi/L)	0	5	1.56	0.042	1.56	2023-24	No	Erosion of natural deposits				
Uranium (ug/L)	0	30	.006	.002	.006	2023-24	No	Erosion of natural deposits				
Contaminants	MCLO	GAL	Your Water	Sampl Date		# Samples ceeding AI	E Exceeds	AL Typical Source				
	Inorganic Contaminants											
Copper (ppm)	0	1.3 .	116	2023	0		No	Corrosion of household plumbing systems; Erosion of natural deposits				
Lead (ppb)	0	15 ()	2022	0		No	Corrosion of household plumbing systems; Erosion of natural deposits				
Total Hardness 238 ppm or 14 grains as of our last test.												

**The City of Ammon did not collect all required Nitrate samples for 2024 and is in violation until these samples are reported to the DEQ. The samples have since been collected and are currently being evaluated by the environmental laboratory.

In addition to the samples reflected above, the municipal water supply was routinely tested for Total Coliform. In 2024, 258 samples were analyzed for Total Coliform. Five of these samples yielded a positive result; however, subsequent samples indicated no evidence of Total Coliform, suggesting an error in the initial sampling method. Corrective actions were subsequently implemented to address this issue.
